Abstract: In 2014–2015 a faunistical survey was carried out in Sălaj County, Romania by the Hungarian Natural History Museum in co-operation with the "Vasile Goldiș" Western University of Arad. Here we report the results regarding braconid wasps (Ichneumonoidea: Braconidae). A total of 167 braconid wasp species were recorded, including 78 species new for the Romanian fauna.

Keywords: faunistics, new record, Romanian fauna, parasitic wasp, Ichneumonoidea

INTRODUCTION:

In 2014–2015 a faunistical survey was carried out in Sălaj County by the Hungarian Natural History Museum (HNHM) in co-operation with the "Vasile Goldiș" Western University of Arad. All specimens reported here were collected within the framework of this co-operation.

All specimens were identified by the first author, and are deposited in the HNHM Hymenoptera Collection. Earlier records of braconid wasp species in the Romanian fauna were checked and traced through Papp (2005) and Yu *et al.* (2012).

Collecting numbers, localities and dates are given in the list below, following in the main Gubányi (2015). Collectors' names are abbreviated in the list as: AGr – Aranka Grabant, AGu – András Gubányi, AK – Attila Kenéz, AO – András Orosz, AP – Attila Podlussány, CsK – Csaba Kutasi, DM – Dávid Murányi, GK – Gergely P. Katona, GP – Gellért Puskás, LD – László Dányi, LR – László Ronkay, MT – Mária Tóth, OM – Ottó Merkl, PS – Péter G. Sulyán, VSz – Viktória Szőke, ZE – Zoltán P. Eröss, ZS – Zoltán Soltész, ZV – Zoltán Vas, ZsB – Zsolt Bálint.

RESULTS AND DISCUSSION:

Subfamilies, genera, and species are ordered alphabetically. Asterisk (*) marks the species new for the Romanian fauna.

Most of the species are frequent and common in the Western Palearctic region; however, some of them show faunistic importance: their distributional data are detailed in the list as a remark following the corresponding species.

CONCLUSIONS:

In the frame of the present faunistic survey 167 species of braconid wasps were recorded from Sălaj County. The Romanian braconid wasp fauna is poorly discovered which is also indicated by the fact that 78 out of the 167 collected species represent their first records in the Romanian fauna. The majority of them are widespread and common species and have been known from several European countries so far.

ACKNOWLEDGEMENTS:

We are grateful to all collectors for collecting Hymenoptera specimens during their field trips.
